

SEO Audit Report

www.placeonix.com

Prepared August 18, 2026 · Consolidated findings from 5 independent SEO audit tools

Executive Summary

This report consolidates findings from five independent SEO audit tools — SEOptimer, RankMath, SEMrush, Seobility, and SEO Site Checkup — run against www.placeonix.com. Scores range from 47 to 82 out of 100 depending on each tool's weighting, but all five point to the same underlying pattern: on-page content and technical fundamentals are largely in place, while off-page authority, social presence, and mobile performance are the primary drag on rankings. Working through the items below in priority order should move every score meaningfully.

Score Snapshot

Tool	Score	Breakdown
RankMath	82 / 100	24 passed · 0 warnings · 3 failed
SEO Site Checkup	70 / 100 (top-site avg: 75)	48 passed · 3 warnings · 12 failed
Seobility	73% on-page score	3 critical issues
SEMrush	47 / 100 overall	On-Page 90% · Technical 80% · Off-Page 0% · Social 20%

Note: SEO Site Checkup also reports an AI Visibility Score of 68/100, reflecting how often ChatGPT, Gemini, and Perplexity currently surface the Placeonix brand in responses.

1. Issues Identified

1.1 Off-Page Authority & Social Presence

Flagged by three of the five tools — the only item marked High Priority in every report that ranks issues by priority.

- No link-building strategy currently in place **HIGH PRIORITY**
- Off-Page SEO scores 0/100; Social Media scores 20/100 (SEMrush)
- No working links to Facebook, X (Twitter), YouTube, or LinkedIn found anywhere on the site — confirmed by both SEMrush and SEOptimer

1.2 Mobile Experience & Site Speed

- Fails SEMrush's mobile-friendliness check: small text, non-responsive layout, tap targets too close together
- Interaction to Next Paint (INP) is sluggish — clicks and taps feel delayed
- DOM size could not be retrieved during the SEMrush crawl, suggesting the page may be intermittently inaccessible
- Page Speed is the single largest failure category in the SEO Site Checkup report (5 failed checks)

1.3 On-Page Content & Keyword Alignment

- Meta description runs 155 characters, above the recommended 100–130
- "Courses" — a core service term — appears nowhere in the title tag, meta description, or headings
- "Training," "Placement," and "Placeonix" appear in the title/meta but not in any heading tag
- H1 text doesn't match the on-page copy, and duplicate heading tags exist on the page (Seobility)

1.4 Technical SEO

- www and non-www versions are not redirected to a single canonical URL **ERROR**
- HTTPS redirect is not fully implemented (SEOptimer)
- Server configuration scored 0% in Seobility's breakdown
- No hreflang tags present — low priority unless targeting multiple regions or languages

1.5 Local SEO & Trust Signals

- No Local Business schema markup detected
- Business address and phone number not found in the page's actual HTML
- No SPF mail record configured on the domain
- No analytics tracking tool detected

2. Recommended Corrections

2.1 Off-Page Authority & Social Presence — Start Here

- Create and link official Facebook, X, YouTube, and LinkedIn profiles from the site header or footer
- Build backlinks through guest posts on ed-tech/career blogs, training-directory listings, and links from placement partners
- Set up and verify a Google Business Profile — strengthens both off-page authority and local search visibility

2.2 Mobile Experience & Site Speed

- Run the live URL through PageSpeed Insights and resolve the specific render-blocking resources it flags
- Defer non-critical JavaScript and audit third-party widgets (chat plugins, trackers) likely responsible for the INP delay
- Test on an actual mobile device — increase font sizes, fix responsive breakpoints, add spacing between tap targets
- Confirm the page loads reliably, then re-run the SEMrush crawl for a clean DOM reading

2.3 On-Page Content & Keyword Alignment

- Shorten the meta description to 100–130 characters
- Rework the H1 and subheadings so "training," "placement," "courses," and "Placeonix" appear naturally — title/meta and headings currently send search engines two different signals
- Remove or rename duplicate heading tags

2.4 Technical SEO

- Implement one 301 rule so www, non-www, and HTTP all resolve to a single canonical HTTPS URL
- Verify HTTPS is enforced sitewide, not only on the homepage
- Review server response headers, compression, and caching configuration
- Add hreflang tags only if targeting additional regions or languages

2.5 Local SEO & Trust Signals

- Add LocalBusiness JSON-LD schema with name, address, phone, and hours
- Display the address and phone number as real, readable text in the footer — not only inside an image or map embed
- Add an SPF record to the domain's DNS settings
- Install Google Analytics 4 or an equivalent tracking tool

3. Suggested Priority Order

1. Off-page links & social profiles
2. Mobile experience & site speed
3. Meta description & heading alignment
4. www / HTTPS canonical redirect
5. Local schema markup
6. Analytics & SPF record

Items 1 and 2 are almost certainly responsible for most of the gap between the site's current 47–82 score range and where it could sit. Fixing off-page authority and content depth also tends to lift AI Visibility — currently 68/100 — since tools like ChatGPT, Gemini, and Perplexity weigh similar signals when deciding how often to surface a brand.
